description

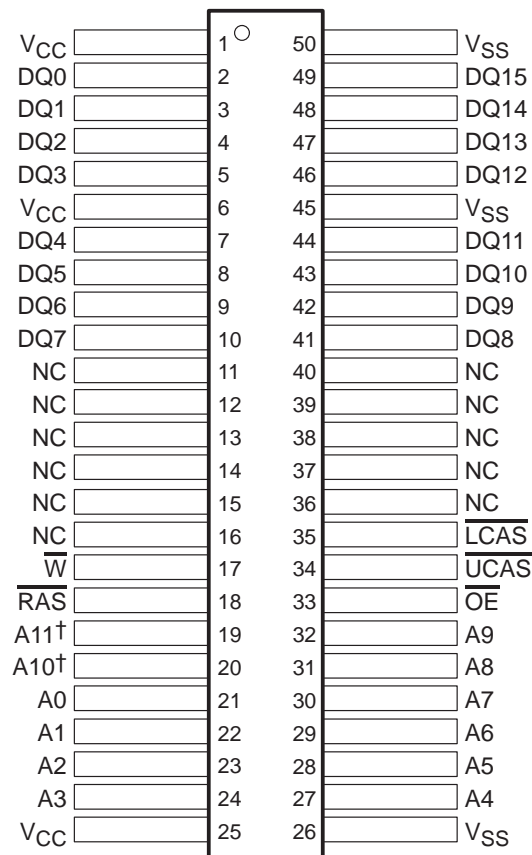

The SMJ41x160 series is a set of 16777216-bit dynamic random-access memories (DRAMs) organized as 1048576 words of 16 bits each.

They employ state-of-the-art technology for high performance, reliability, and low power at low cost.

These devices feature maximum $\overline{\text{RAS}}$ access times of 70 ns and 80 ns. All addresses and data-in lines are latched on-chip to simplify system design. Data out is unlatched to allow greater system flexibility.

The SMJ41x160 series is offered in a 50-lead, 650-mil-wide ceramic flatpack and is characterized for operation from –55°C to 125°C.

HKD PACKAGE (TOP VIEW)

† A10 and A11 are NC for SMJ418160.

| PIN NOMENCLATURE | |
|--------------------------|-----------------------------|
| A0–A11 | Address Inputs |
| DQ0–DQ15 | Data In/Data Out |
| $\overline{\text{LCAS}}$ | Lower Column-Address Strobe |
| $\overline{\text{UCAS}}$ | Upper Column-Address Strobe |
| NC | No Internal Connection |
| $\overline{\text{OE}}$ | Output Enable |
| $\overline{\text{RAS}}$ | Row-Address Strobe |
| V _{CC} | 5-V Supply |
| V _{SS} | Ground |
| $\overline{\text{W}}$ | Write Enable |

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

'416160 functional block diagram

'418160 functional block diagram

operation

dual $\overline{\text{CAS}}$

Two $\overline{\text{CAS}}$ pins ($\overline{\text{LCAS}}$ and $\overline{\text{UCAS}}$) are provided to give independent control of the 16 data-I/O pins (DQ0–DQ15), with $\overline{\text{LCAS}}$ corresponding to DQ0–DQ7 and $\overline{\text{UCAS}}$ corresponding to DQ8–DQ15. For read or write cycles, the column address is latched on the first $\overline{\text{xCAS}}$ falling edge. Each $\overline{\text{xCAS}}$ going low enables its corresponding DQx pin with data associated with the column address latched on the first falling $\overline{\text{xCAS}}$ edge. All address-setup and -hold parameters are referenced to the first falling $\overline{\text{xCAS}}$ edge. The delay time from $\overline{\text{xCAS}}$ low to valid data out (see parameter t_{CAC}) is measured from each individual $\overline{\text{xCAS}}$ to its corresponding DQx pin.

In order to latch in a new column address, both $\overline{\text{xCAS}}$ pins must be brought high. The column-precharge time (see parameter t_{CP}) is measured from the last $\overline{\text{xCAS}}$ rising edge to the first $\overline{\text{xCAS}}$ falling edge of the new cycle. Keeping a column address valid while toggling $\overline{\text{xCAS}}$ requires a minimum setup time, t_{CLCH} . During t_{CLCH} , at least one $\overline{\text{xCAS}}$ must be brought low before the other $\overline{\text{xCAS}}$ is taken high.

For early-write cycles, the data is latched on the first $\overline{\text{xCAS}}$ falling edge. Only the DQs that have the corresponding $\overline{\text{xCAS}}$ low are written into. Each $\overline{\text{xCAS}}$ must meet t_{CAS} minimum in order to ensure writing into the storage cell. To latch a new address and new data, all $\overline{\text{xCAS}}$ pins must be high and meet t_{CP} .

enhanced page mode

Enhanced page-mode operation allows faster memory access by keeping the same row address while selecting random column addresses. The time for row-address setup and hold and address multiplex is eliminated. The maximum number of columns that can be accessed is determined by the maximum $\overline{\text{RAS}}$ low time and the $\overline{\text{xCAS}}$ page-mode cycle time used. With minimum $\overline{\text{xCAS}}$ page-cycle time, all columns can be accessed without intervening $\overline{\text{RAS}}$ cycles.

Unlike conventional page-mode DRAMs, the column-address buffers in this device are activated on the falling edge of $\overline{\text{RAS}}$. The buffers act as transparent or flow-through latches while $\overline{\text{xCAS}}$ is high. The falling edge of the first $\overline{\text{xCAS}}$ latches the column addresses. This feature allows the device to operate at a higher data bandwidth than conventional page-mode parts because data retrieval begins as soon as the column address is valid rather than when $\overline{\text{xCAS}}$ goes low. This performance improvement is referred to as enhanced page mode. A valid column address can be presented immediately after row-address hold time (t_{RAH}) has been satisfied, usually well in advance of the falling edge of $\overline{\text{xCAS}}$. In this case, data is obtained after access time from $\overline{\text{xCAS}}$ low (t_{CAC}) maximum if access time from column address (t_{AA}) maximum has been satisfied. In the event that column addresses for the next page cycle are valid at the time $\overline{\text{xCAS}}$ goes high, minimum-access time for the next cycle is determined by access time from rising edge of the last $\overline{\text{xCAS}}$ (t_{CPA}).

address: A0–A11 ('416160) and A0–A9 ('418160)

Twenty address bits are required to decode one of the 1048576 storage-cell locations. For the SMJ416160, 12 row-address bits are set up on A0 through A11 and latched onto the chip by $\overline{\text{RAS}}$. Eight column-address bits are set up on A0 through A7 and latched onto the chip by the first $\overline{\text{xCAS}}$. For the SMJ418160, ten row-address bits are set up on A0–A9 and latched onto the chip by $\overline{\text{RAS}}$. Ten column-address bits are set up on A0–A9 and latched onto the chip by the first $\overline{\text{xCAS}}$. All addresses must be stable on or before the falling edge of $\overline{\text{RAS}}$ and $\overline{\text{xCAS}}$. $\overline{\text{RAS}}$ is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. $\overline{\text{xCAS}}$ is used as a chip select, activating its corresponding output buffer and latching the address bits into the column-address buffers.

write enable ($\overline{\text{W}}$)

The read or write mode is selected through $\overline{\text{W}}$. A logic high on $\overline{\text{W}}$ selects the read mode and a logic low selects the write mode. The data inputs are disabled when the read mode is selected. When $\overline{\text{W}}$ goes low prior to $\overline{\text{xCAS}}$ (early write), data out remains in the high-impedance state for the entire cycle, permitting a write operation with $\overline{\text{OE}}$ grounded.

data in (DQ0–DQ15)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the falling edge of \overline{xCAS} or \overline{W} strobes data into the on-chip data latch. In an early-write cycle, \overline{W} is brought low prior to \overline{xCAS} and the data is strobed in by the first \overline{xCAS} occurrence with setup and hold times referenced to this signal. In a delayed-write or read-modify-write cycle, \overline{xCAS} is low already and the data is strobed in by \overline{W} with setup and hold times referenced to this signal. In a delayed-write or read-modify-write cycle, \overline{OE} must be high to bring the output buffers to the high-impedance state prior to impressing data on the I/O lines.

data out (DQ0–DQ15)

Data out is the same polarity as data in. The output is in the high-impedance (floating) state until \overline{xCAS} and \overline{OE} are brought low. In a read cycle, the output becomes valid after the access-time interval t_{CAC} . t_{CAC} begins with the negative transition of \overline{xCAS} as long as t_{RAC} and t_{AA} are satisfied.

output enable (\overline{OE})

\overline{OE} controls the impedance of the output buffers. When \overline{OE} is high, the buffers remain in the high-impedance state. Bringing \overline{OE} low during a normal cycle activates the output buffers, putting them in the low-impedance state. It is necessary for both \overline{RAS} and \overline{xCAS} to be brought low for the output buffers to go into the low-impedance state, and they remain in the low-impedance state until either \overline{OE} or \overline{xCAS} is brought high.

\overline{RAS} -only refresh '416160

A refresh operation must be performed at least once every 32 ms to retain data. This can be achieved by strobing each of the 4096 rows (A0–A11). A normal-read or -write cycle refreshes all bits in each row that is selected. A \overline{RAS} -only operation can be used by holding both \overline{xCAS} at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a \overline{RAS} -only refresh.

\overline{RAS} -only refresh '418160

A refresh operation must be performed at least once every 8 ms to retain data. This can be achieved by strobing each of the 1024 rows (A0–A9). A normal-read or -write cycle refreshes all bits in each row that is selected. A \overline{RAS} -only operation can be used by holding both \overline{xCAS} at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a \overline{RAS} -only refresh.

hidden refresh

Hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding \overline{xCAS} at V_{IL} after a read operation and cycling \overline{RAS} after a specified precharge period, similar to a \overline{RAS} -only refresh cycle. The external address is ignored and the refresh address is generated internally.

\overline{xCAS} -before- \overline{RAS} (xCBR) refresh

xCBR refresh is utilized by bringing at least one \overline{xCAS} low earlier than \overline{RAS} (see parameter t_{CSR}) and holding it low after \overline{RAS} falls (see parameter t_{CHR}). For successive xCBR refresh cycles, \overline{xCAS} can remain low while cycling \overline{RAS} . The external address is ignored and the refresh address is generated internally.

power up

To achieve proper device operation, an initial pause of 200 μ s followed by a minimum of eight initialization cycles is required after power up to the full V_{CC} level. These eight initialization cycles must include at least one refresh (\overline{RAS} -only or xCBR) cycle.

13. Transition times (rise and fall) should be a minimum of 3 ns and a maximum of 30 ns. This is ensured by design but not tested.

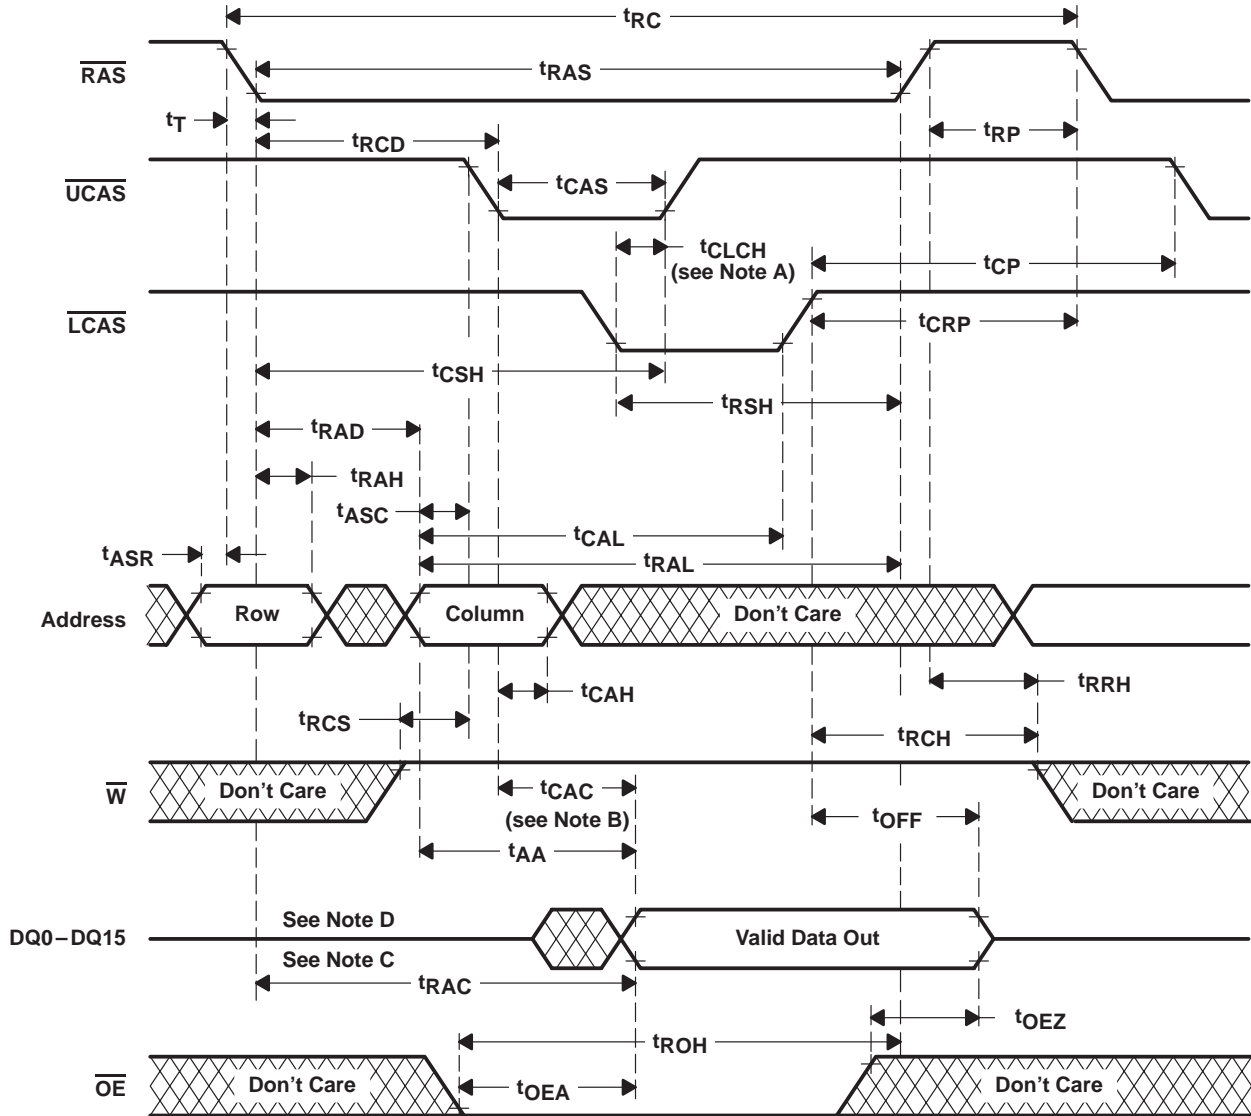

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. C_L includes probe and fixture capacitance.
 B. The ac timing parameters are specified with reference to the minimum valid high-level voltage and the maximum valid low-level voltage for each signal. This corresponds to 2.4 V and 0.8 V for inputs; 2.4 V and 0.4 V for outputs with the given load circuit.

Figure 1. Load Circuits and Voltage Waveforms

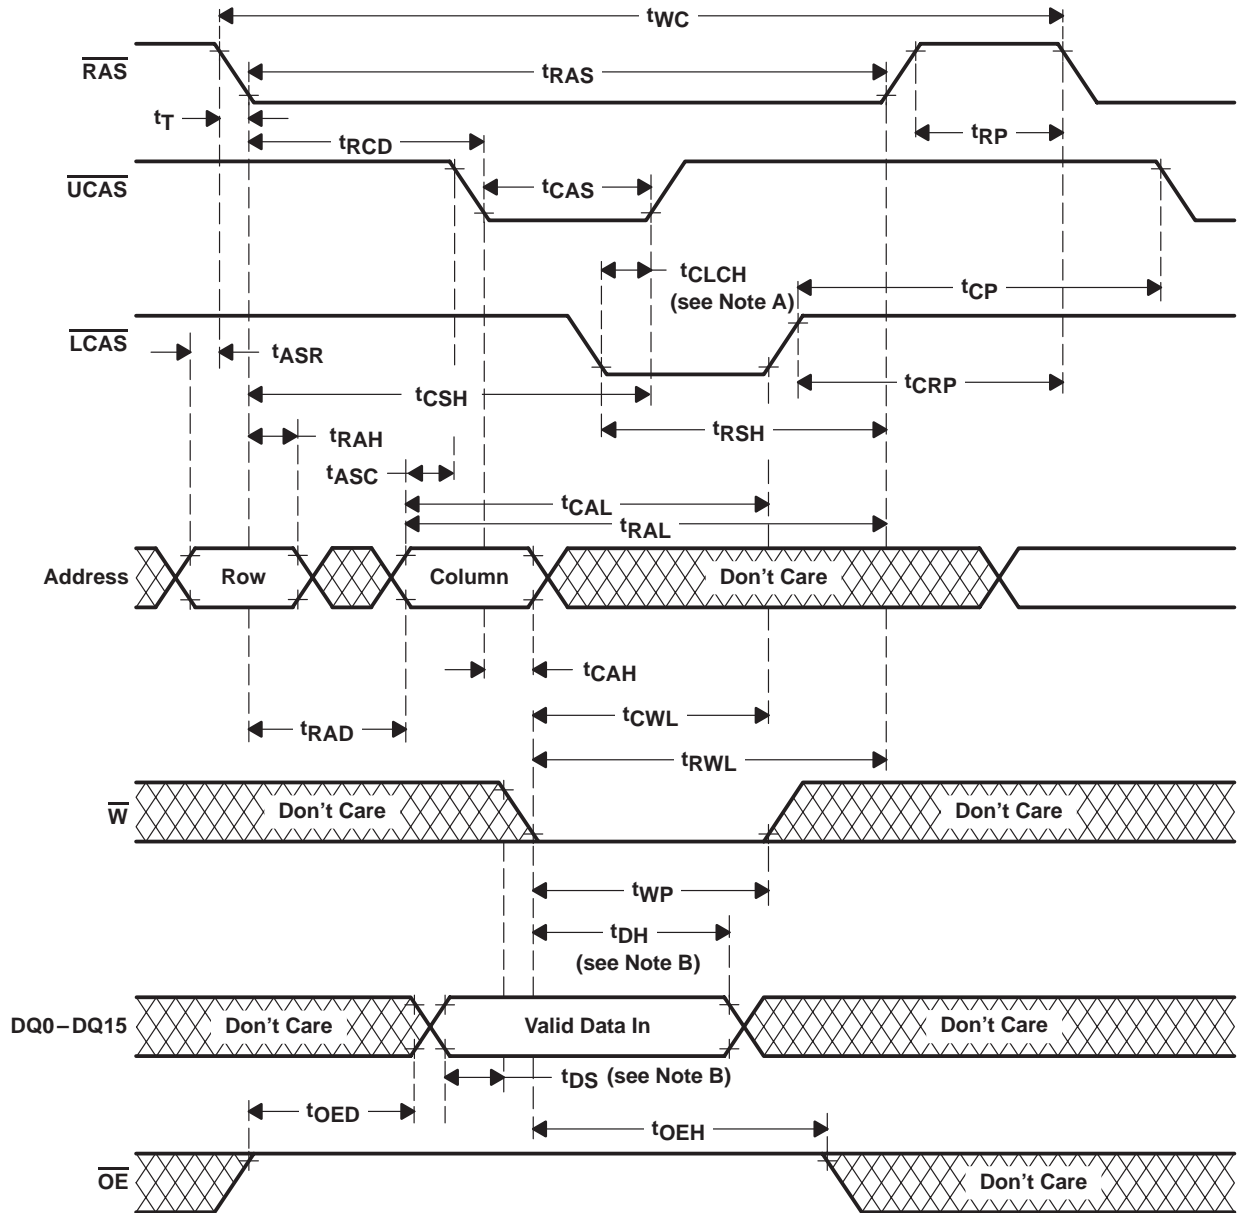

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. To hold the address latched by the first xCAS going low, the parameter t_{CLCH} must be met.
 B. t_{CAC} is measured from xCAS to its corresponding DQx.
 C. Output can go from the high-impedance state to an invalid-data state prior to the specified access time.
 D. xCAS order is arbitrary.

Figure 2. Read-Cycle Timing

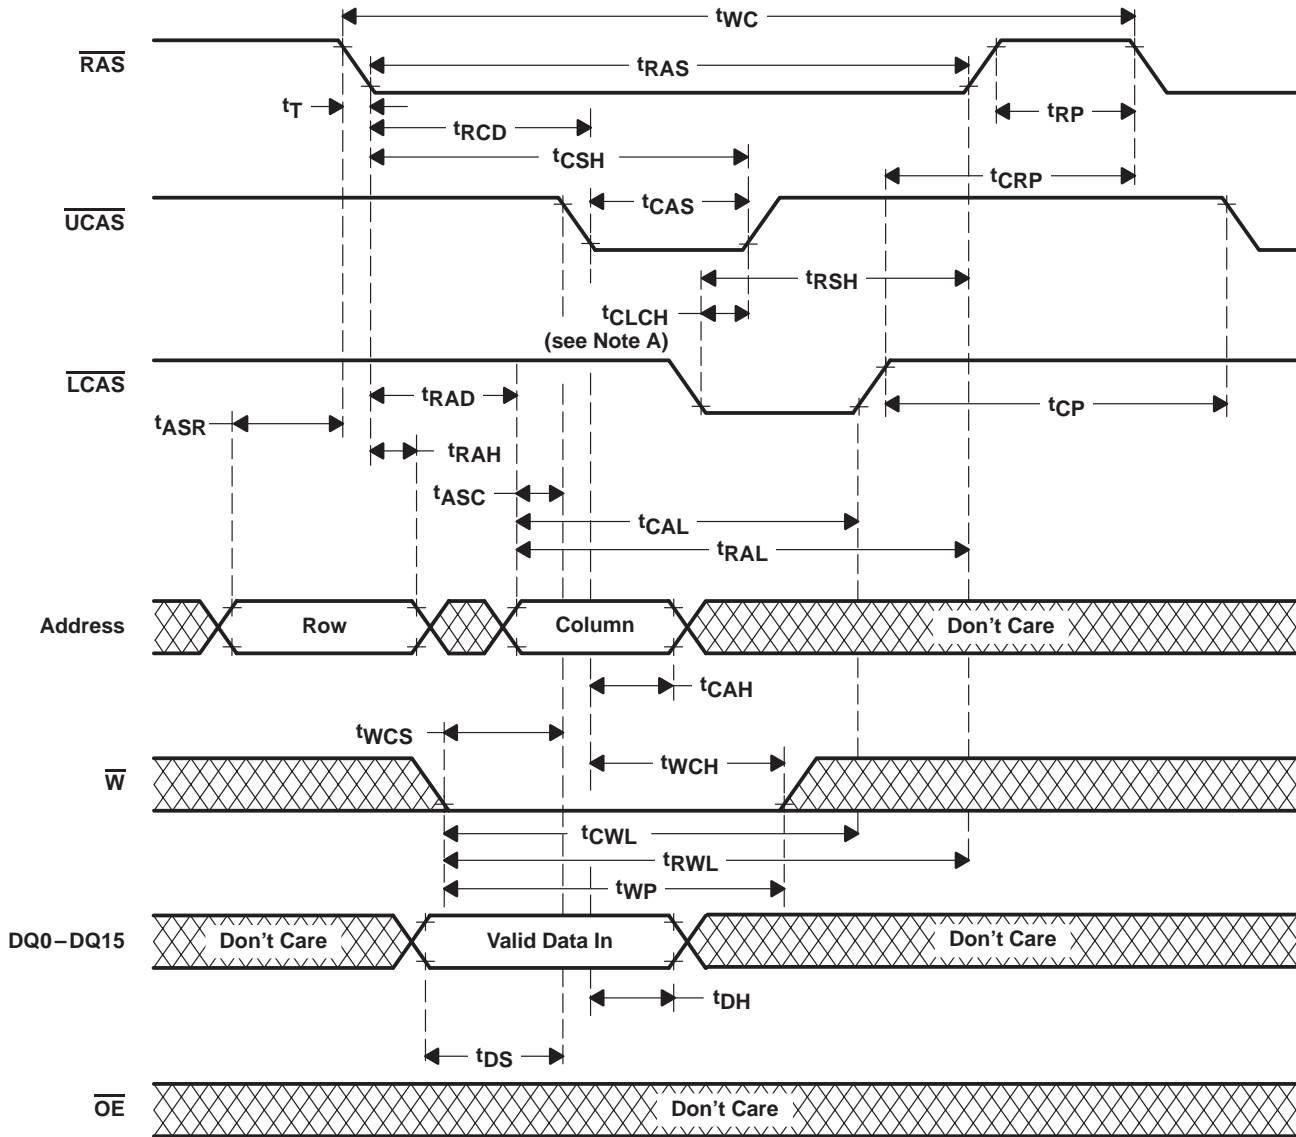

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. To hold the address latched by the first xCAS going low, the parameter t_{CLCH} must be met.
 B. Referenced to the first xCAS or \bar{W} , whichever occurs last
 C. xCAS order is arbitrary.

Figure 3. Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

NOTES: A. To hold the address latched by the first \overline{xCAS} going low, the parameter t_{CLCH} must be met.
 B. \overline{xCAS} order is arbitrary.

Figure 4. Early-Write-Cycle Timing

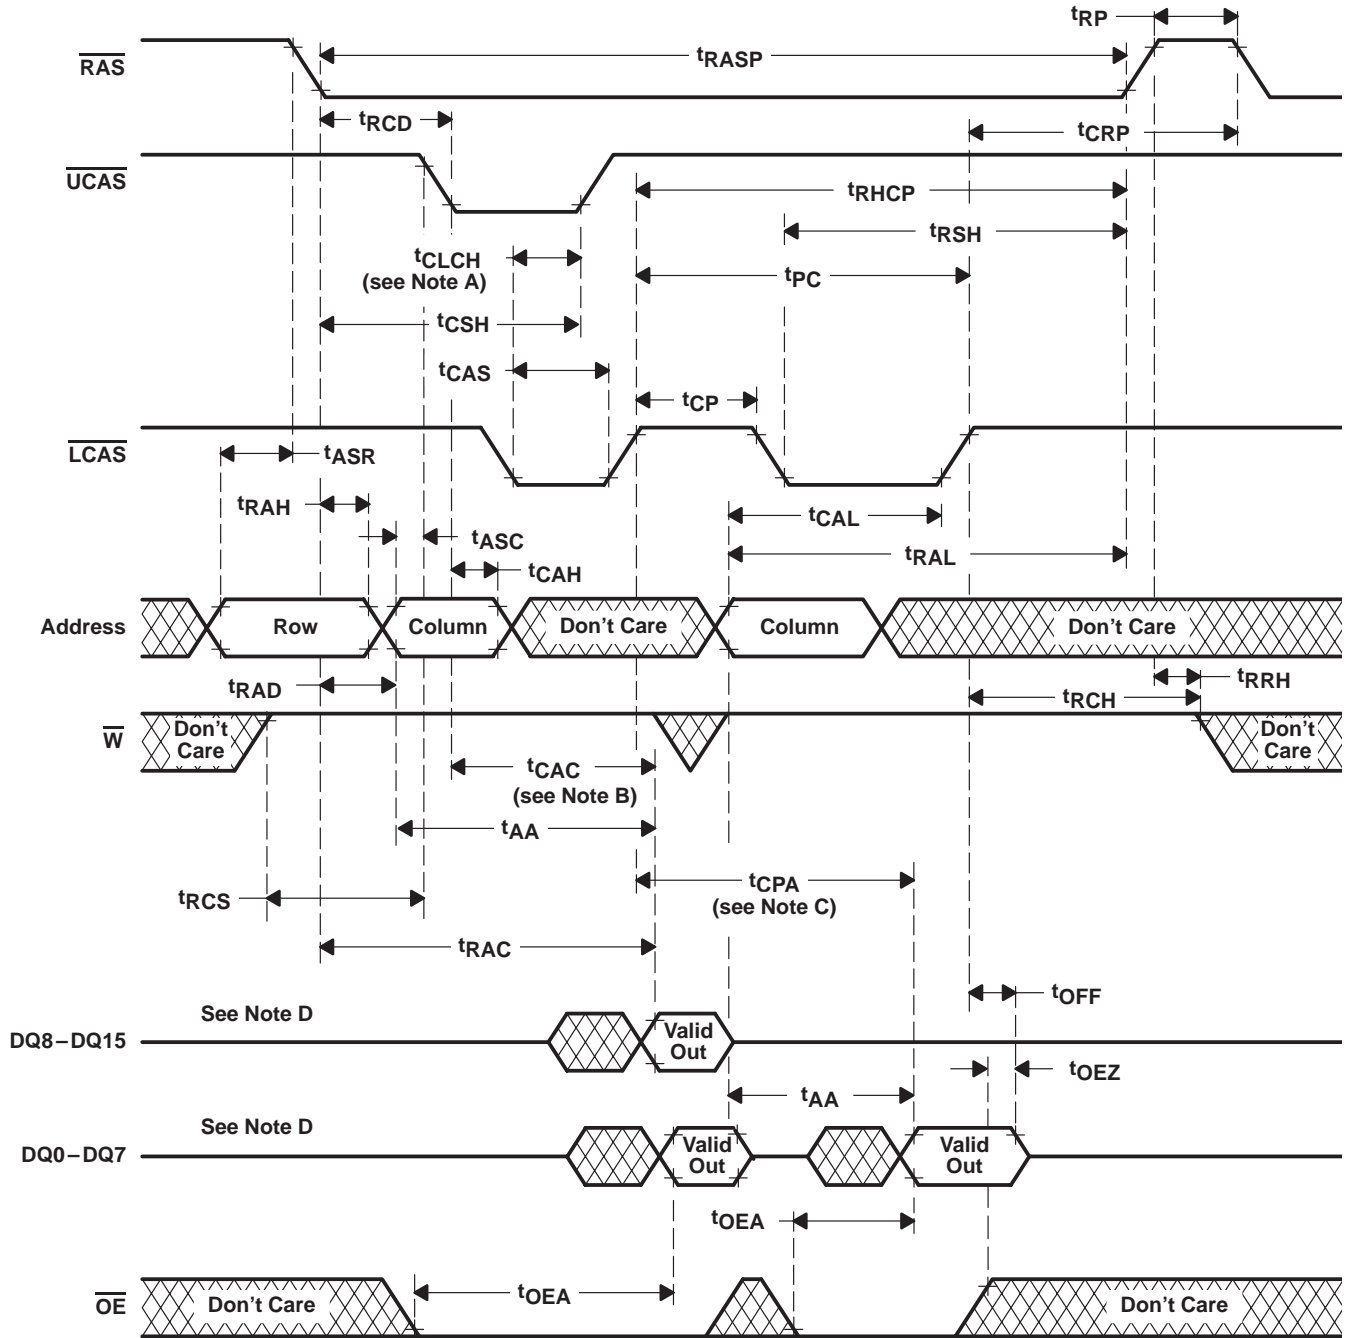

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. To hold the address latched by the first xCAS going low, the parameter t_{CLCH} must be met.
 B. Output can go from the high-impedance state to an invalid-data state prior to the specified access time.
 C. t_{CAC} is measured from xCAS to its corresponding DQx.
 D. xCAS order is arbitrary.

Figure 5. Read-Modify-Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

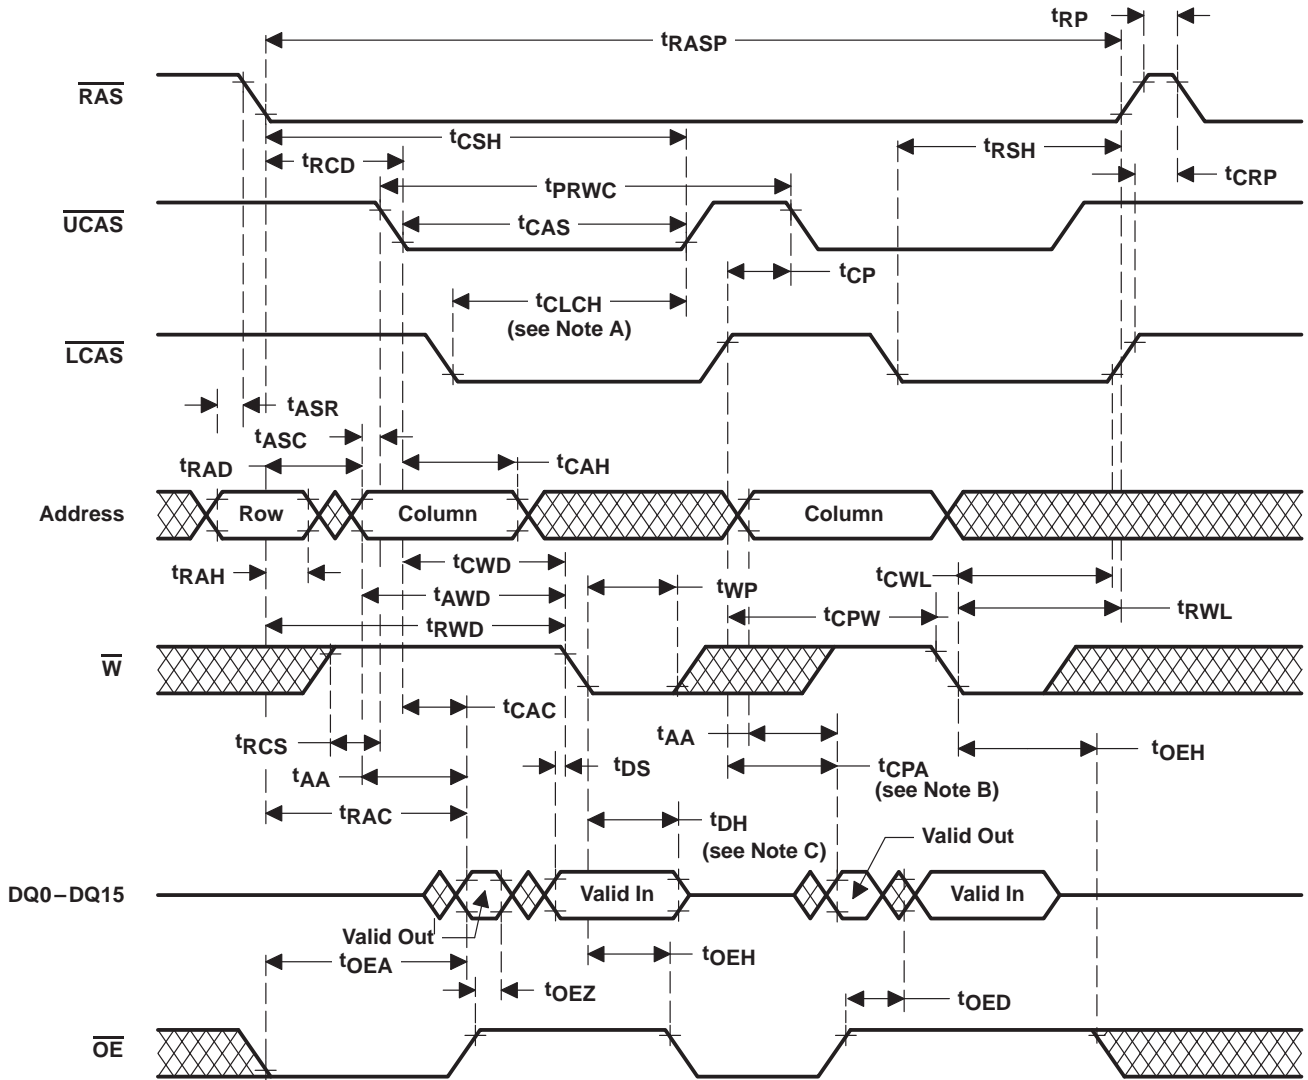

- NOTES: A. To hold the address latched by the first xCAS going low, the parameter t_{CLCH} must be met.
 B. t_{CAC} is measured from xCAS to its corresponding DQx.
 C. Access time is t_{CPA}- or t_{AA}-dependent.
 D. Output can go from the high-impedance state to an invalid-data state prior to the specified access time.
 E. A write cycle or read-modify-write cycle can be mixed with the read cycles as long as the write- and read-modify-write timing specifications are not violated.
 F. xCAS order is arbitrary.

Figure 6. Enhanced-Page-Mode Read-Cycle Timing

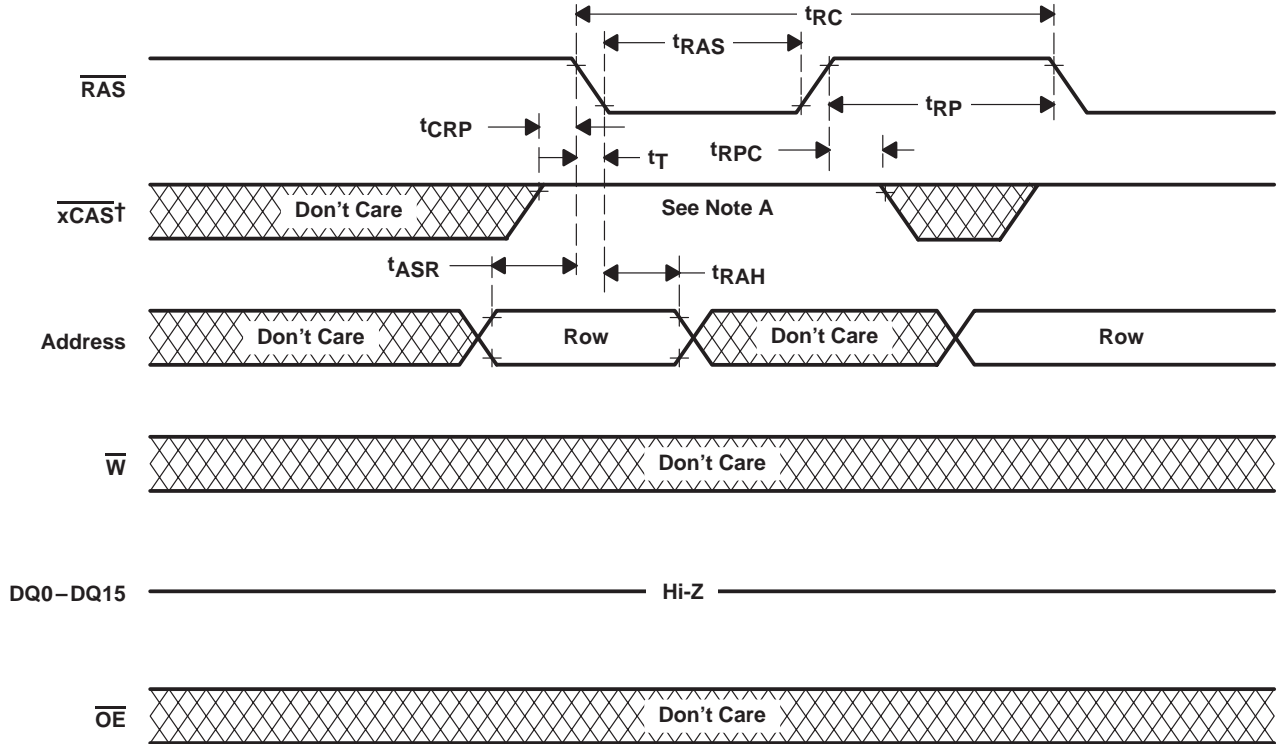

PARAMETER MEASUREMENT INFORMATION

- NOTES:
- A. To hold the address latched by the first $\overline{x}CAS$ going low, the parameter t_{CLCH} must be met.
 - B. Access time is t_{CPA} - or t_{AA} -dependent.
 - C. \overline{Output} can go from the high-impedance state to an invalid-data state prior to the specified access time.
 - D. $\overline{x}CAS$ order is arbitrary.
 - E. A read or write cycle can be intermixed with read-modify-write cycles as long as the read- and write-cycle timing specifications are not violated.
 - F. t_{CAC} is measured from $\overline{x}CAS$ to its corresponding DQx .

Figure 8. Enhanced-Page-Mode Read-Modify-Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

† \overline{LCAS} or \overline{UCAS}

NOTE A: All xCAS must be high.

CERAMIC DUAL FLATPACK

- NOTES: A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. The leads will be gold plated.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
